

Step 1: Switch to root user
sudo su

Step 2: Update package lists
apt update -y

Step 3: Install Docker
apt install docker.io -y

Step 4: Check running Docker containers
docker ps

Step 5: Clone the React project from GitHub
git clone <https://github.com/MaX-NeO/aws-cicd.git>

Step 6: List files and folders
ls

Step 7: Navigate to the project directory
cd aws-cicd

Step 8: List project files
ls

Step 9: Build the Docker image
docker build . -t reactapp

Step 10: Check available Docker images
docker images

Step 11: Run the React application container
docker run -itd -p 80:80 reactapp

Step 12: Check the running container
docker ps

Step 13: Stop the running container
docker stop 37f1

Step 14: Verify that no containers are running
docker ps

Step 15: List all containers, including stopped containers
docker ps -a

Step 16: Remove the stopped container
docker rm 37f1

Step 17: Verify that all containers have been removed
docker ps -a

Step 18: List all Docker images
docker images

Step 19: Remove the React application Docker image
docker rm 1677

Step 20: Verify the remaining Docker images
docker images
